Discontinuation: DIGI-KAST

Dear Ladies and Gentlemen

This letter is to inform you of the discontinuation of the DIGI-KAST warp let-off control.

25 years after the development of the DIGI-KAST family of devices, stocks of spare parts are now running out and some of them can no longer be reproduced. Some electronic components are no longer available. There are still a few controllers and motors of the device family in stock. We can still repair the discontinued product for you, depending on the technical feasibility and availability of spare parts.

Successor product: LCM warp let-off controller

For the discontinued product we offer our LCM control as a successor product. With the LCM control, one or two warp beams can be controlled. The control is based on a servo drive.

The use of new technologies and components are the central building blocks for this successful investment in the future. A capacitive full-colour touch screen is used as the operating and display device. This enables easy interaction with the control system as well as improved visualisation of the process data.

The LCM control is a Swiss product that was developed in a cooperative partnership. Extensive software ensures that the control can be adapted to the most diverse customer requirements.

We thank you for your understanding and trust for further cooperation in the future.

Best regards

Andreas Wirz
Sales Manager
